

4 : Project Integration Management

IT4306– IT Project Management

Level II - Semester 4

Intended Learning Outcomes

- At the end of this lesson, you will be able to;
 - Describe what project integration management is and outline its main processes
 - Explain the strategic planning process and apply different project selection methods
 - Explain the importance of creating a project charter to formally initiate projects
 - Discuss the process of creating a preliminary project scope statement
 - Describe project management plan development and its content
 - Explain project execution

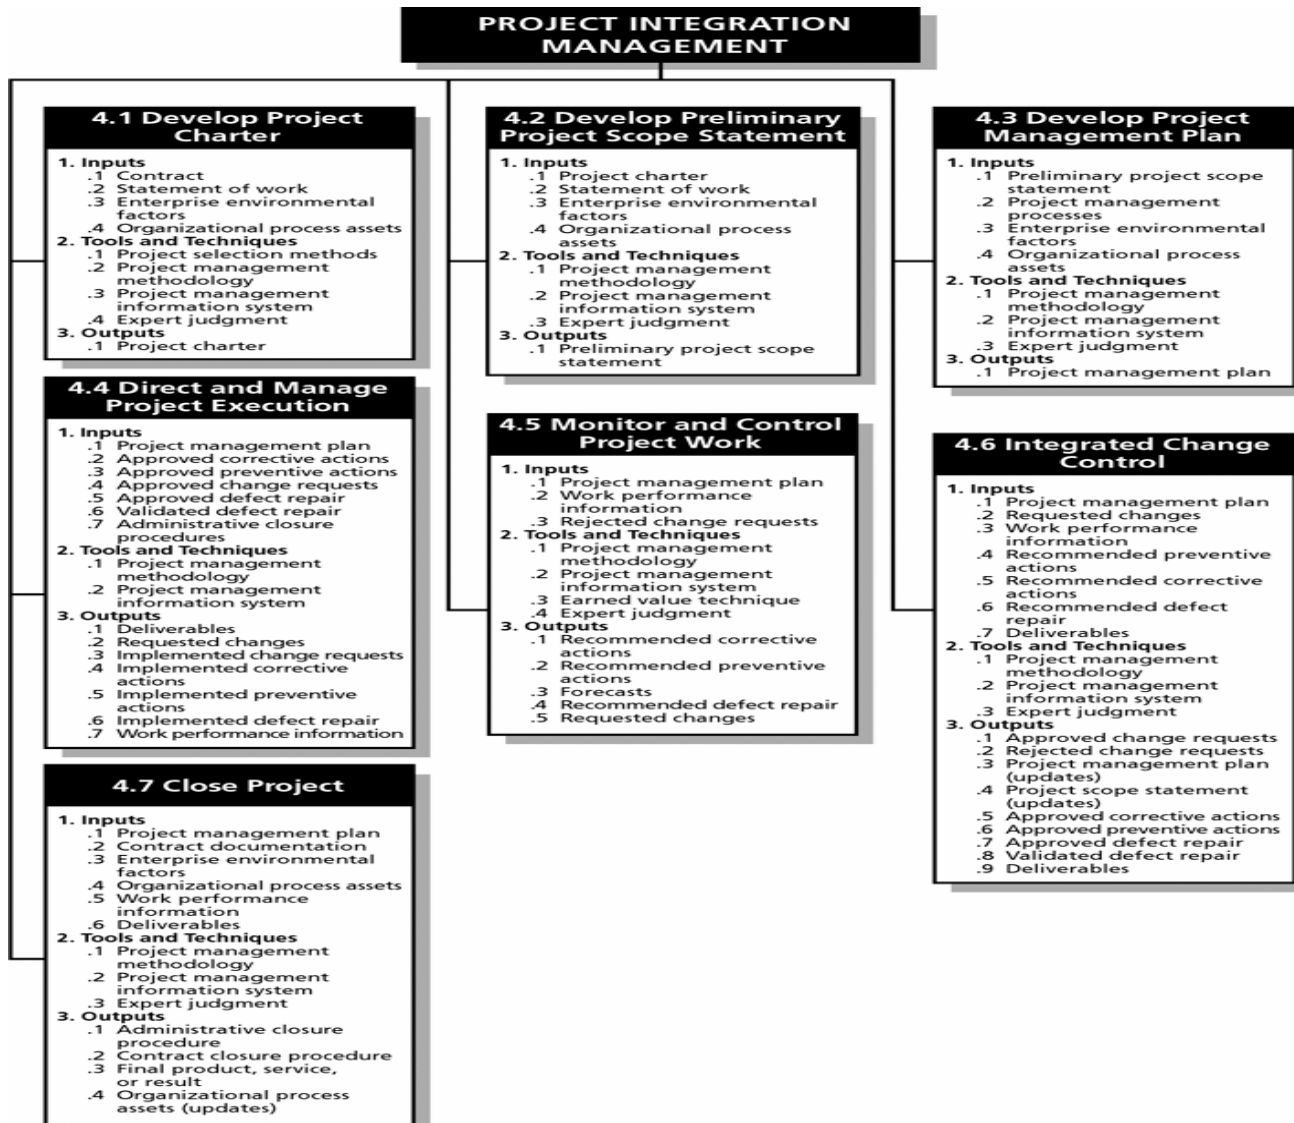

Intended Learning Outcomes (cont.)

- At the end of this lesson, you will be able to;
 - Describe the process of monitoring and controlling project work
 - Describe the integrated change control process, planning for and managing changes on information technology project
 - Explain the importance of developing good procedures for closing projects

4.1. What is Project Integration Management (PIM)?

- The Key to Overall Project Success: Good Project Integration Management
- Project managers must coordinate all of the other knowledge areas throughout a project's life cycle.
- Many new project managers have trouble looking at the "big picture" and want to focus on too many details.
- Project integration management is not the same thing as software integration.
- It includes processes required to ensure that the various elements of the project are properly coordinated.

Project Integration Management Overview

Project Integration Management Processes

- **Develop the project charter:** Work with stakeholders to create the document that formally authorizes a project—the charter.
- **Develop the preliminary project scope statement:** Work with stakeholders, especially users of the project's products, services, or results, to develop the high-level scope requirements and create a preliminary project scope statement.
- **Develop the project management plan:** Coordinate all planning efforts to create a consistent, coherent document—the project management plan.

Project Integration Management Processes (cont.)

- **Direct and manage project execution:** Carry out the project management plan by performing the activities included in it.
- **Monitor and control the project work:** Oversee project work to meet the performance objectives of the project.
- **Perform integrated change control:** Coordinate changes that affect the project's deliverables and organizational process assets.
- **Close the project:** Finalize all project activities to formally close the project.

4.2. Strategic Planning and Project Selection

4.2.1. Strategic Planning

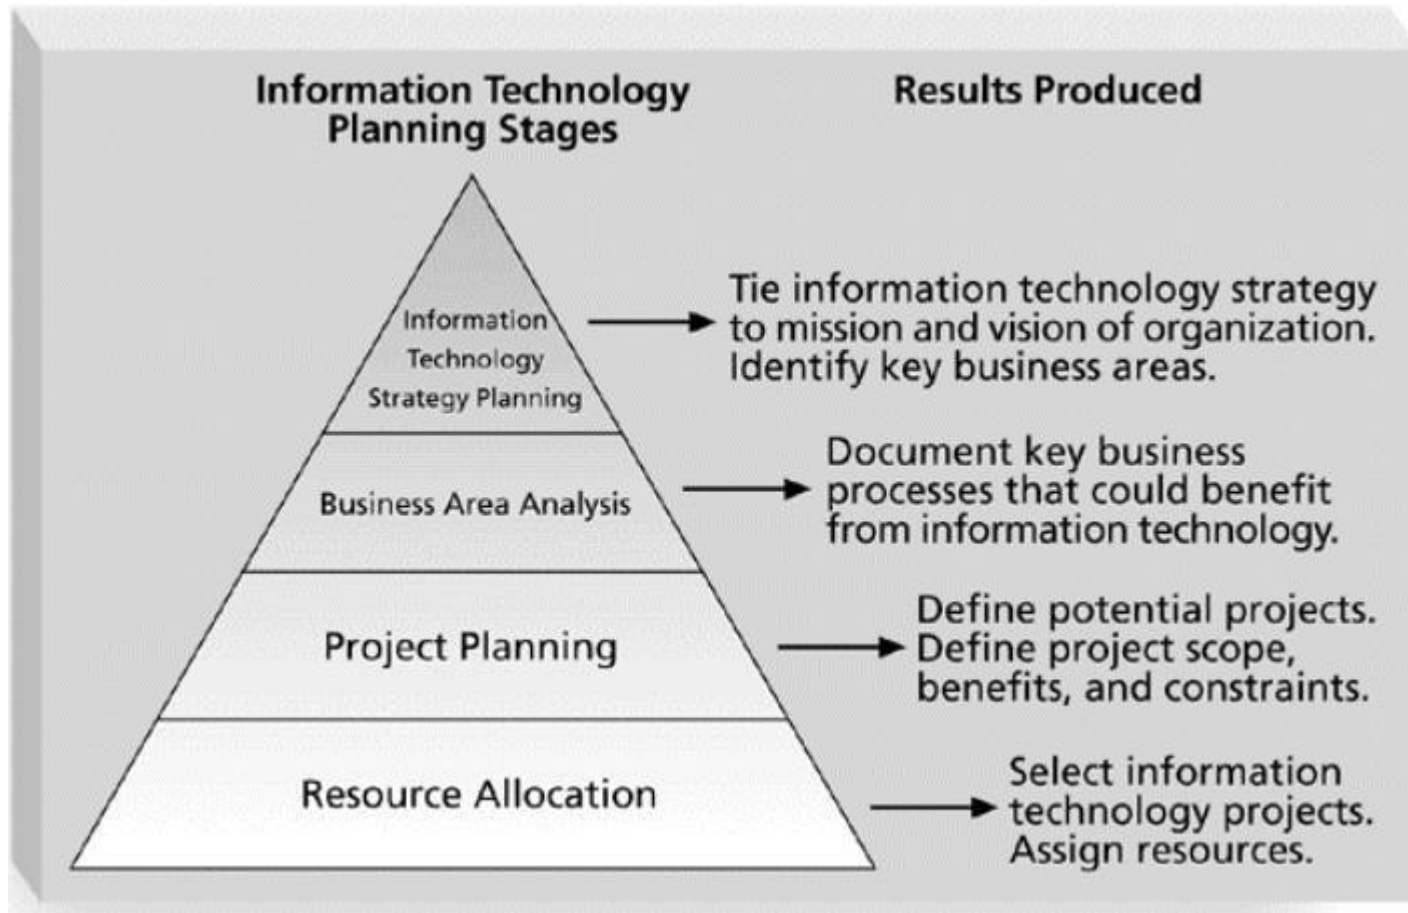

- **Strategic planning** involves determining long-term objectives, predicting future trends, and projecting the need for new products and services.
- Organizations often perform a **SWOT analysis**:
 - **S**trengths, **W**eaknesses, **O**pportunities, and **T**hreats
- As part of strategic planning, organizations should:
 - Identify potential projects.
 - Use realistic methods to select which projects to work on.
 - Formalize project initiation by issuing a project charter.

4.2.2. Identifying Potential Projects

- Many organizations follow a planning process for selecting IT projects.
- It's crucial to align IT projects with business strategy.
- Research shows that:
 - Supporting explicit business objectives is the number one reason cited for investing in IT projects.
 - Companies with consolidated IT operations have a 24 percent lower operational cost per end user.
 - The consistent use of IT standards lowers application development costs by 41 percent per user.*

*Cosgrove Ware, Lorraine, "By the Numbers," *CIO Magazine* (www.cio.com) (September 1, 2002).

Information Technology Planning Process

4.3. Methods for Selecting Projects

- There is usually not enough time or resources to implement all projects.
- Methods for selecting projects include:
 - Focusing on broad organizational needs.
 - Categorizing information technology projects.
 - Performing net present value or other financial analyses.
 - Using a weighted scoring model.
 - Implementing a balanced scorecard.

4.3.1. Focusing on Broad Organizational Needs

- It is often difficult to provide strong justification for many IT projects, but everyone agrees they have a high value.
- "It is better to measure gold roughly than to count pennies precisely."
- Three important criteria for projects:
 - There is a **need** for the project.
 - There are **funds** available for the project.
 - There is a strong **will** to make the project succeed.

4.3.2. Categorizing IT Projects

- One categorization assesses whether the project provides a response to:
 - A problem
 - An opportunity
 - A directive
- Another categorization is based on the time it will take to complete a project or the date by which it must be done.
- Another categorization is the overall priority of the project.

4.3.3. Performing Financial Analyses

- Financial considerations are often an important aspect of the project selection process.
- Three primary methods for determining the projected financial value of projects:
 - Net present value (NPV) analysis
 - Return on investment (ROI)
 - Payback analysis

Net Present Value Analysis

- **Net Present Value** (NPV) analysis is a method of calculating the expected net monetary gain or loss from a project by discounting all expected future cash inflows and outflows to the present point in time.
- Projects with a positive NPV should be considered if financial value is a key criterion.
- The higher the NPV, the better.

Net Present Value Example

	A	B	C	D	E	F	G
1	Discount rate	10%					
2							
3	PROJECT 1	YEAR 1	YEAR 2	YEAR 3	YEAR 4	YEAR 5	TOTAL
4	Benefits	\$0	\$2,000	\$3,000	\$4,000	\$5,000	\$14,000
5	Costs	\$5,000	\$1,000	\$1,000	\$1,000	\$1,000	\$9,000
6	Cash flow	(\$5,000)	\$1,000	\$2,000	\$3,000	\$4,000	\$5,000
7	NPV →	\$2,316					
8		Formula =npv(b1,b6:f6)					
9							
10	PROJECT 2	YEAR 1	YEAR 2	YEAR 3	YEAR 4	YEAR 5	TOTAL
11	Benefits	\$1,000	\$2,000	\$4,000	\$4,000	\$4,000	\$15,000
12	Costs	\$2,000	\$2,000	\$2,000	\$2,000	\$2,000	\$10,000
13	Cash flow	(\$1,000)	\$0	\$2,000	\$2,000	\$2,000	\$5,000
14	NPV →	\$3,201					
15		Formula =npv(b1,b13:f13)					
16							

Note that totals are equal, but NPVs are not because of the time value of money.

JWD Consulting NPV Example

Multiply by the discount factor each year, then subtract costs from cumulative benefits to get NPV.

Discount rate	8%					
Assume the project is completed in Year 0			Year			
	0	1	2	3	Total	
Costs	140,000	40,000	40,000	40,000		
Discount factor	1	0.93	0.86	0.79		
Discounted costs	140,000	37,200	34,400	31,600	243,200	
Benefits	0	200,000	200,000	200,000		
Discount factor	1	0.93	0.86	0.79		
Discounted benefits	0	186,000	172,000	158,000	516,000	
Discounted benefits - costs	(140,000)	148,800	137,600	126,400	272,800	← NPV
Cumulative benefits - costs	(140,000)	8,800	146,400	272,800		
ROI	112%					
	Payback In Year 1					

NPV Calculations

- Determine estimated costs and benefits for the life of the project and the products it produces.
- Determine the discount rate (check with your organization on what to use).
- Calculate the NPV (see text for details).
- Some organizations consider the investment year as year 0, while others consider it year 1. Some people enter costs as negative numbers, while others do not. Make sure to identify your organization's preferences.

Return on Investment

- **Return on investment** (ROI) is calculated by subtracting the project costs from the benefits and then dividing by the costs.

$$\text{ROI} = \frac{(\text{total discounted benefits} - \text{total discounted costs})}{\text{discounted costs}}$$

- The higher the ROI, the better.
- Many organizations have a required rate of return or minimum acceptable rate of return on investment for projects.
- Internal rate of return (IRR) can be calculated by setting the NPV to zero.

Payback Analysis

- Another important financial consideration is payback analysis.
- The **payback period** is the amount of time it will take to recoup, in the form of net cash inflows, the total dollars invested in a project.
- Payback occurs when the cumulative discounted benefits and costs are greater than zero.
- Many organizations want IT projects to have a fairly short payback period.

Charting the Payback Period

4.4. Developing a Project Charter

- After deciding what project to work on, it is important to let the rest of the organization know.
- A **project charter** is a document that formally recognizes the existence of a project and provides direction on the project's objectives and management.
- Key project stakeholders should sign a project charter to acknowledge agreement on the need and intent of the project; a signed charter is a key output of project integration management.

Preliminary Scope Statements

- A **scope statement** is a document used to develop and confirm a common understanding of the project scope.
- It is an important tool for preventing **scope creep**:
 - The tendency for project scope to keep getting bigger.
- A good practice is to develop a preliminary or initial scope statement during project initiation and a more detailed scope statement as the project progresses.

Contents of a Preliminary Scope Statement

- Project objectives
- Product or service requirements and characteristics
- Project boundaries
- Deliverables
- Product acceptance criteria
- Project assumptions and constraints
- Organizational structure for the project
- Initial list of defined risks
- Summary of schedule milestones
- Rough order of magnitude cost estimate
- Configuration management requirements
- Description of approval requirements

4.5. Developing a Project Management Plan

- A **project management plan** is a document used to coordinate all project planning documents and help guide a project's execution and control.
- Plans created in the other knowledge areas are subsidiary parts of the overall project management plan.

Attributes of Project Plans

- Just as projects are unique, so are project plans.
- Plans should be:
 - Dynamic
 - Flexible
 - Updated as changes occur
- Plans should first and foremost guide project execution by helping the project manager lead the project team and assess project status.

4.5.1. Project Management Plan Contents

- Introduction or overview of the project.
- Description of how the project is organized.
- Management and technical processes used on the project.
- Work to be done, schedule, and budget information.

4.5.2. Using Guidelines to Create Project Management Plans

Sample Contents for a Software Project Management Plan (SPMP)

MAJOR PROJECT MANAGEMENT PLAN SECTIONS					
	OVERVIEW	PROJECT ORGANIZATION	MANAGERIAL PROCESS PLANS	TECHNICAL PROCESS PLANS	SUPPORTING PROCESS PLANS
Section Topics	Purpose, scope, and objectives; assumptions and constraints; project deliverables; schedule and budget summary; evolution of the plan	External interfaces; internal structure; roles and responsibilities	Start-up plans (estimation, staffing, resource acquisition, and project staff training plans); work plan (work activities, schedule, resource, and budget allocation); control plan; risk management plan; closeout plan	Process model; methods, tools, and techniques; infrastructure plan; product acceptance plan	Configuration management plan; verification and validation plan; documentation plan; quality assurance plan; reviews and audits; problem resolution plan; subcontractor management plan; process improvement plan

IEEE Standard 1058-1998.

4.6. Directing and Managing Project Work

4.6.1. Coordinating Planning and Execution

- Project planning and execution are intertwined and inseparable activities.
- Those who will do the work should help to plan the work.
- Project managers must solicit input from the team to develop realistic plans.

4.6. Directing and Managing Project Work

Project Execution

- Project execution involves managing and performing the work described in the project management plan.
- The majority of time and money is usually spent on execution.
- The application area of the project directly affects project execution because the products of the project are produced during project execution.

4.6.2. Providing Strong Leadership and a Supportive Culture

- Project managers must lead by example to demonstrate the importance of creating and then following good project plans.
- Organizational culture can help project execution by:
 - Providing guidelines and templates.
 - Tracking performance based on plans.
- Project managers may still need to break the rules to meet project goals, and senior managers must support those actions.

Important Skills for Project Execution

- General management skills such as leadership, communication, and political skills.
- Product, business, and application area skills and knowledge.
- Use of specialized tools and techniques.

4.6.4. Project Execution Tools and Techniques

- **Project management methodology:** Many experienced project managers believe the most effective way to improve project management is to follow a methodology that describes not only what to do in managing a project, but how to do it.
- **Project management information systems:** Hundreds of project management software products are available on the market today, and many organizations are moving toward powerful enterprise project management systems that are accessible via the Internet.
- See the “What Went Right?” example of Kuala Lumpur’s Integrated Transport Information System.

4.8. Monitoring and Controlling Project Work

- Changes are inevitable on most projects, so it's important to develop and follow a process to monitor and control changes.
- Monitoring project work includes collecting, measuring, and disseminating performance information.
- Two important outputs of monitoring and controlling project work include recommended corrective and preventive actions.

4.9. Performing Integrated Change Control

- Three main objectives are:
 - Influence the factors that create changes to ensure that changes are beneficial.
 - Determine that a change has occurred.
 - Manage actual changes as they occur.
- A **baseline** is the approved project management plan plus approved changes.

4.9.1. Change Control on IT Projects

- **Former view:** The project team should strive to do exactly what was planned on time and within budget.
- **Problem:** Stakeholders rarely agreed beforehand on the project scope, and time and cost estimates were inaccurate.
- **Modern view:** Project management is a process of constant communication and negotiation.
- **Solution:** Changes are often beneficial, and the project team should plan for them.

4.9.2. Change Control System

- A formal, documented process that describes when and how official project documents and work may be changed.
- Describes who is authorized to make changes and how to make them.

Change Control Boards (CCBs)

- A formal group of people responsible for approving or rejecting changes on a project.
- CCBs provide guidelines for preparing change requests, evaluate change requests, and manage the implementation of approved changes.
- CCBs include stakeholders from the entire organization.

4.10. Closing Projects or Phases

- To close a project, you must finalize all activities and transfer the completed or cancelled work to the appropriate people.
- Main outputs include:
 - Administrative closure procedures.
 - Contract closure procedures.
 - Final products, services, or results.
 - Organizational process asset updates.

4.11. Using Software to Assist in Project Integration Management

- Several types of software can be used to assist in project integration management:
 - Word processing software creates documents.
 - Presentation software creates presentations.
 - Spreadsheets or databases perform tracking.
 - Communication software such as e-mail and Web authoring tools facilitate communications.
 - Project management software can pull everything together and show detailed and summarized information.

4.11. Using Software to Assist in Project Integration Management

- Several types of software can be used to assist in project integration management:
 - Word processing software creates documents.
 - Presentation software creates presentations.
 - Spreadsheets or databases perform tracking.
 - Communication software such as e-mail and Web authoring tools facilitate communications.
 - Project management software can pull everything together and show detailed and summarized information.

4.12. Considerations for Agile/Adaptive Environments

Making Timely Changes

- Some CCBs only meet occasionally, so it may take too long for changes to occur.
- Some organizations have policies in place for time-sensitive changes.
 - A “48-hour policy” allows project team members to make a decision and have 48 hours to seek approval from top management. If the team decision cannot be implemented, management has 48 hours to reverse a decision; otherwise, the team’s decision is approved.
 - Another policy is to delegate changes to the lowest level possible, but keep everyone informed of changes.

Summary

- Project integration management includes:
 - Developing a project charter.
 - Developing a preliminary project scope statement.
 - Developing a project management plan.
 - Directing and managing project execution.
 - Monitoring and controlling project work.
 - Performing integrated change control.
 - Closing the project.
